PREFACE

This is a supplementary volume to Rand report R-1168-PR,^{*} which presents tables of damage probability as a function of nuclear bomb yield and delivery CEP for 50 selected P vulnerability numbers (PVNs) associated with hardened military targets. The supplement was prepared in response to requests by Air Force officers and agencies for additional damage probability tables estimating outcomes of attacks on certain overpressure-sensitive P-type and dynamic-pressure-sensitive Q-type point targets not listed in R-1168-PR.

The additional Probability of Damage (PD) tables presented here cover 56 PVNs and 52 QVNs of current military interest. The tables should be useful to Air Force planners and analysts in providing a quick-access source for data not otherwise readily available.

^{*}D. C. Kephart, *Some Aids for Estimating Damage Probabilities in Attacks Against Targets with P and Q Vulnerability Numbers*, The Rand Corporation, R-1168-PR, March 1973, For Official Use Only.

SOME AIDS FOR ESTIMATING DAMAGE PROBABILITIES IN ATTACKS AGAINST
TARGETS WITH P AND Q VULNERABILITY NUMBERS: SUPPLEMENTARY
TABLES FOR POINT TARGETS

The computed tables in this supplement show single-shot probability of damage to a point target as a function of yield and circular probable error (CEP), for a weapon bursting at an altitude that approximately maximizes the probability of blast damage. Definitions, assumptions, and mathematical bases for the damage tables are as detailed in R-1168-PR and in *Physical Vulnerability Handbook--Nuclear Weapons* (U), Defense Intelligence Agency, AP-550-1-2-69-INT, 1 June 1969 (Confidential).

For target vulnerability numbers (VNs) and yield-CEP combinations not listed in this supplement or in R-1168-PR, an interactive computing program is available as described in R-1168-PR for calculating additional Probability of Damage (PD) tables via remote teletype coupling to Rand's JOSS computer. The computing program also calculates discrete sets of air-burst and ground-burst damage probabilities for both point targets and circular area targets with an offset aim point option for any yield-CEP combination, for both P-type VNs (PVNs) and Q-type VNs (QVNs).

The quantities listed in the computer printout PD tables are identified below:

VN = arbitrary classification of a target's susceptibility to blast damage (as defined in R-1168-PR and in DIA's *Physical Vulnerability Handbook*)

KT = warhead yield, kilotons

Adj VN = adjusted VN, to account for yield-dependent damage response

psi = peak over pressure (for PVNs), or peak dynamic pressure (for QVNs) at the weapon radius, lb/sq in.

HOB = weapon height of burst, associated with "maximum" probability of damage, ft

WR = weapon radius, ft

CEP = circular probable error weapon delivery accuracy, ft

PD = single-shot probability of damage.

The following table lists the VNs for which PD tables appear either in this supplement or in R-1168-PR. The quantity VN refers to the first two digits of the unadjusted PVN or QVN. The K-factor is the last digit of the PVN or QVN. The yield and CEP values tabulated in this supplement are not identical to those in R-1168-PR. To help expand the utility of the PD tables, several values were added at the low ends of the yield-CEP ranges, while others were omitted at the high ends.
